

## Service bulletin “Front to back step Cage Adjustment”

When installing the GlowStep Revolution you will notice the hardware hole locations on the side of the step cage are slotted for 5/8" adjustability as seen in the photo below. All other steps (Not including the GlowStep Revolution) require the step to be pushed all the way back up against the trailers frame for additional support since the steps do not contact the ground. With the Earth to RV design of the GlowStep Revolution there is no need to install the step against the frame of the RV but rather pull it out towards the RV's side wall so it is flush with the outer face of the side of the RV. This is the proper installation location to provide adequate space for the safety release level pin.

Note- Pushing the GlowStep Revolution frame all the way back may cause the Safety pin to catch or drag along the RV's side wall potentially damaging the painted surface of the RV over time.
